

# Flow NAIL From FLOW-FX

**Designed as a new, revolutionary modality for intertrochanteric or subtrochanteric fractures by combining an intramedullary fixation device with a precise bone void filler delivery method.**

Patented technology enables precision delivery of bone void fillers to the desired area. Upon implantation, the bone void fillers set hard to provide compressive strength comparable to cancellous bone. The resulting osteoconductive scaffold provides interconnected porosity that facilitates cell mediated remodeling at the same rate as the surrounding bone.

- **Patented Side-Port Cannula** delivers the BVF where the surgeon needs it through the appropriate fenestrations while protecting the hip joint from unintended intrusion of the biologic material.
- Combines the utility and efficacy of the top orthobiologic platforms – ETEX CarriGen and Beta-bsm – with the best delivery mechanisms to ensure **accurate and precise placement of the BVF** to the desired implantation site while using manual low-pressure delivery.
- Flow-Nail is **available in 125 and 130 degree neck angles** with 180 and 200 mm lengths to allow for the treatment of the majority of fractures in this area.
- Design is consistent with currently available devices to ensure **familiarity and ease of use**.
